OpenCore

Reference Manual (0.8.2.3)

[2022.07.09]

Note 1: Due to using system NVRAM reset, this option is not compatible with the `--preserve-boot` option and will override it, therefore all BIOS boot entries will be removed.

Note 2: Due to using system NVRAM reset, the OpenCore boot option cannot be preserved and OpenCore will have to either be reselected in the native boot picker or re-blessed.

Note 3: On non-Apple hardware, this option will still set this variable but the variable will not be recognised by the firmware and no NVRAM reset will happen.

11.7.2 ToggleSipEntry

Provides a boot entry for enabling and disabling System Integrity Protection (SIP) in OpenCore picker.

While macOS is running, SIP involves multiple configured software protection systems, however all the information about which of these protections to enable is stored in the single Apple NVRAM variable `csr-active-config`. As long as this variable is set before macOS startup, SIP will be fully configured, so setting the variable using this boot option (or in any other way, before macOS starts) has exactly the same end result as configuring SIP using the `csrutil` command in macOS Recovery.

`csr-active-config` will be toggled between `0` for enabled, and a user-specified or default value for disabled. The default value is `0x27F` (see below). Any other required value can be specified as a single number in the `Arguments` for this driver. This can be specified as hexadecimal, beginning with `0x`, or as decimal.

Note 1: It is recommended not to run macOS with SIP disabled. Use of this boot option may make it easier to quickly disable SIP protection when genuinely needed - it should be re-enabled again afterwards.

Note 2: The default value for disabling SIP with this boot entry is `0x27F`. For comparison, `csrutil disable` with no other arguments on macOS Big Sur and Monterey sets `0x7F`, and on Catalina it sets `0x77`. The OpenCore default value of `0x27F` is a variant of the Big Sur and Monterey value, chosen as follows:

- `CSR_ALLOW_UNAPPROVED_KEXTS` (`0x200`) is included in the default value, since it is generally useful, in the case where you need to have SIP disabled anyway, to be able to install unsigned kexts without manual approval in System Preferences.
- `CSR_ALLOW_UNAUTHENTICATED_ROOT` (`0x800`) is not included in the default value, as it is very easy when using it to inadvertently break OS seal and prevent incremental OTA updates.
- If unsupported bits from a later OS are specified in `csr-active-config` (e.g. specifying `0x7F` on Catalina) then `csrutil status` will report that SIP has a non-standard value, however protection will be functionally the same.

11.8 AudioDxe

High Definition Audio (HDA) support driver in UEFI firmware for most Intel and some other analog audio controllers.

Note: AudioDxe is a staging driver, refer to acidanthera/bugtracker#740 for known issues.

11.8.1 Configuration

Most UEFI audio configuration is handled via the `UEFI Audio Properties` section, but ~~if required the following additonal configuration options (which are needed to produce sound on most Apple hardware, and possibly some others) may be specified in UEFI/Drivers/Arguments:~~ in addition some of the following configuration options may be required in order to allow AudioDxe to correctly drive certain devices. All options are specified as text strings, separated by space if more than one option is required, in the `Arguments` property for the driver within the `UEFI/Drivers` section:

- `--force-device` - String value, no default.

  When this option is present and has a value (e.g. `--force-device=PciRoot(0x0)/Pci(0x1f,0x3)`), it forces AudioDxe to connect to the specified PCI device, even if the device does not report itself as an HDA audio controller.
  During driver connection, AudioDxe automatically provides audio services on all supported codecs of all available HDA controllers. However, if the relevant controller is misreporting its identity (typically, it will be reporting itself as a legacy audio device instead of an HDA controller) then this argument may be required.

Applies if the audio device can be made to work in macOS, but shows no sign of being detected by AudioDxe (e.g. when including `DEBUG_INFO` in `DisplayLevel` and using a DEBUG build of AudioDxe, no controller and codec layout information is displayed during the `Connecting drivers...` phase of OpenCore log).

- `--gpio-setup` - Default value is `0` (GPIO setup disabled) if argument is not provided, or `7` (all GPIO setup stages stages enabled) if the argument is provided with no value.

  Available values, which may be combined by adding, are:

  - `0x00000001` (bit `0`) — `GPIO_SETUP_STAGE_DATA`, set GPIO pin data high on specified pins. Required e.g. on `MacBookPro10,2` and `MacPro5,1`.
  - `0x00000002` (bit `1`) — `GPIO_SETUP_STAGE_DIRECTION`, set GPIO data direction to output on specified pins. Required e.g. on `MacPro5,1`.
  - `0x00000004` (bit `2`) — `GPIO_SETUP_STAGE_ENABLE`, enable specified GPIO pins. Required e.g. on `MacPro5,1`.

  If audio appears to be 'playing' on the correct codec, e.g. based on the debug log, but no sound is heard on any channel, it is suggested to use `--gpio-setup` (with no value) in the AudioDxe driver arguments. If specified with no value, all stages will be enabled (equivalent of specifying `7`). If this produces sound, it is then possible to try fewer bits, e.g. `--gpio-setup=1`, `--gpio-setup=3`, to find out which stages are actually required.

  Note: Value `7` (all flags enabled) of this option – as required for the `MacPro5,1` – is compatible with most systems, but is known to cause problems with sound (previous sounds are not allowed to finish before new sounds start) on a small number of other systems, hence this option is not enabled by default.

- `--gpio-pins` - Default: `0`, auto-detect.

  Specifies which GPIO pins should be operated on by `--gpio-setup`. This is a bit mask, with possible values from `0x0` to `0xFF`. The usable maximum depends on the number if available pins on the audio out function group of the codec in use, e.g. it is `0x3` (lowest two bits) if two GPIO pins are present, `0x7` if three pins are present, etc.

  When `--gpio-setup` is enabled (i.e. non-zero), then `0` is a special value for `--gpio-pins`, meaning that the pin mask will be auto-generated based on the reported number of GPIO pins on the specified codec (see `AudioCodec`), e.g. if the codec's audio out function group reports 4 GPIO pins, a mask of `0xF` will be used. The value in use can be seen in the debug log in a line such as:

  ```
  HDA: GPIO setup on pins 0x0F - Success
  ```

  Values for driver parameters can be specified in hexadecimal beginning with `0x` or in decimal, e.g. `--gpio-pins=0x12` or `--gpio-pins=18`.

- `--restore-nosnoop` - Boolean flag, enabled if present.

  AudioDxe clears the Intel HDA No Snoop Enable (NSNPEN) bit. On some systems, this change must be reversed on exit in order to avoid breaking sound in Windows or Linux. If so, this flag should be added to AudioDxe driver arguments. Not enabled by default, since restoring the flag can prevent sound from working in macOS on some other systems.

11.9 Properties

1. `APFS`
   Type: `plist dict`
   Failsafe: None
   Description: Provide APFS support as configured in the APFS Properties section below.

2. `AppleInput`
   Type: `plist dict`
   Failsafe: None
   Description: Configure the re-implementation of the Apple Event protocol described in the AppleInput Properties section below.

3. `Audio`
   Type: `plist dict`
   Failsafe: None
   Description: Configure audio backend support described in the `Audio Properties` section below.
